

Fig. 3. Problem (I).

Fig. 5. Problem (III).

$$K = K_I + iK_{II} \tag{12}$$

The stresses at distance  $r$  ahead of the crack-tip are related to this complex stress intensity factor by

$$\sigma_{ij} = \frac{K}{\sqrt{2\pi r}} f_{ij}(\theta) \tag{13}$$

$$K_o = |K| = \sqrt{K_I^2 + K_{II}^2} \tag{16}$$

$$\Psi = \tan^{-1}(K_{II}/K_I) \tag{17}$$

It can be shown (see, e.g. Ref. 44) that the maximum amplitude of the singular stresses in the vicinity of the

phase angle  $\Psi^*$  are obtained for the various geometric and material property parameters considered. Tables 3a
